

Adoption of Open Science Practices in Psychology and Education Research

ANONYMOUS AUTHOR(S)

Open science practices like data and code availability are (what exactly). To what extent do researcher actually implement OSF-practices in their publications? Do institutions explicitly value these principles in their hiring process and research conduct?

We examine open science practices within the top 10 journals by h_5 -index in Special Education, Education and Psychology. Specifically, we analyse the frequency of *open science statements* and *data and code-availability* in [N] published open access articles alongside the prevalence of open science *expectations* and *requirements* in job advertisements for professorships at German universities. We found that bla ...

1 Introduction

2 Analysis

rieser: Should we provide a sample of keywords here?

2.1 Job postings for professorships

We analysed job postings for professorships from the *Academic Job Posting Service of the German Association of University Professors and Lecturers* [1] published between January 2024 and [tbd.] 2025. Out of a total of $N_A = 295$ postings, 18 of them explicitly mentioned keywords related to open science. While all 18 described open science as desirable, only [$k=6$] required a formal statement. Exactly 1 was a specifically created "W2 Open Science" professorship . We identified these postings by matching keywords, their mangled variants, and partial sentences and extracting their containing sentences; the final classification however was based on manual review of the corresponding paragraphs.

rieser: double check this

rieser: Should we analyse Subject and department? Does it matter if 4 of these were from the same university? Does English <-> German matter?

rieser: I need to add to the code here to make sure that all keywords are hit and all of them provide a paragraph. Else the desirable <-> requirement stat might be wrong.

2.2 Publications

We analysed [N=?] open access publications from Journals [J1,J2,...] filtered by the OpenAlex index [2]. In this process, we checked for the presence of either/or an open science statement, a data availability statement, an open access dataset or open access code. Based on this, we found that [k_1 out of N] included a dataset, [k_2 out of N] included their code, [k_3 out of N] included an open science statement of data availability statement. [k_4 out of N] contained all 3.

We analysed the top 20 Journals in education and special education. For a full list see List of Journals. We filtered these journals using the OpenAlex index [2].

rieser: Should we devise a score here? So dataset + statement + code gives highest score.

3 Implementation

We extracted all *works* from the OpenAlex [2] corpus that were tagged as belonging to the fields Psychology or Education. From these records, we retained the ones that included at least one linked open access PDF. To manage this dataset, we implemented a database consisting of two tables: an **index** table containing the metadata for each entry, and a **pdfs** table storing information about the retrieved documents.

rieser: explain what this means or phrase differently

rieser: This is not done yet

Because of hardware limitations and the large volume of file , we implemented a batched processing pipeline. This pipeline retrieves and processes PDFs in batches of size $k = 200$. After processing, the results are joined onto the bibliographic data from the index table for further analysis. Before moving onto the next batch, the pdfs are deleted and marked as downloaded and/or processed in the **pdfs**-table.

rieser: How many GBs?

50 4 Related Work

51 We could mention dataset here, even if we adapt it. Otherwise, fexrep [5].
